

Chatter Linux Client

Enterprise collaboration without compromise.

Native Performance.

Ultimate Privacy.

Zero Bloat.

NotebookLM

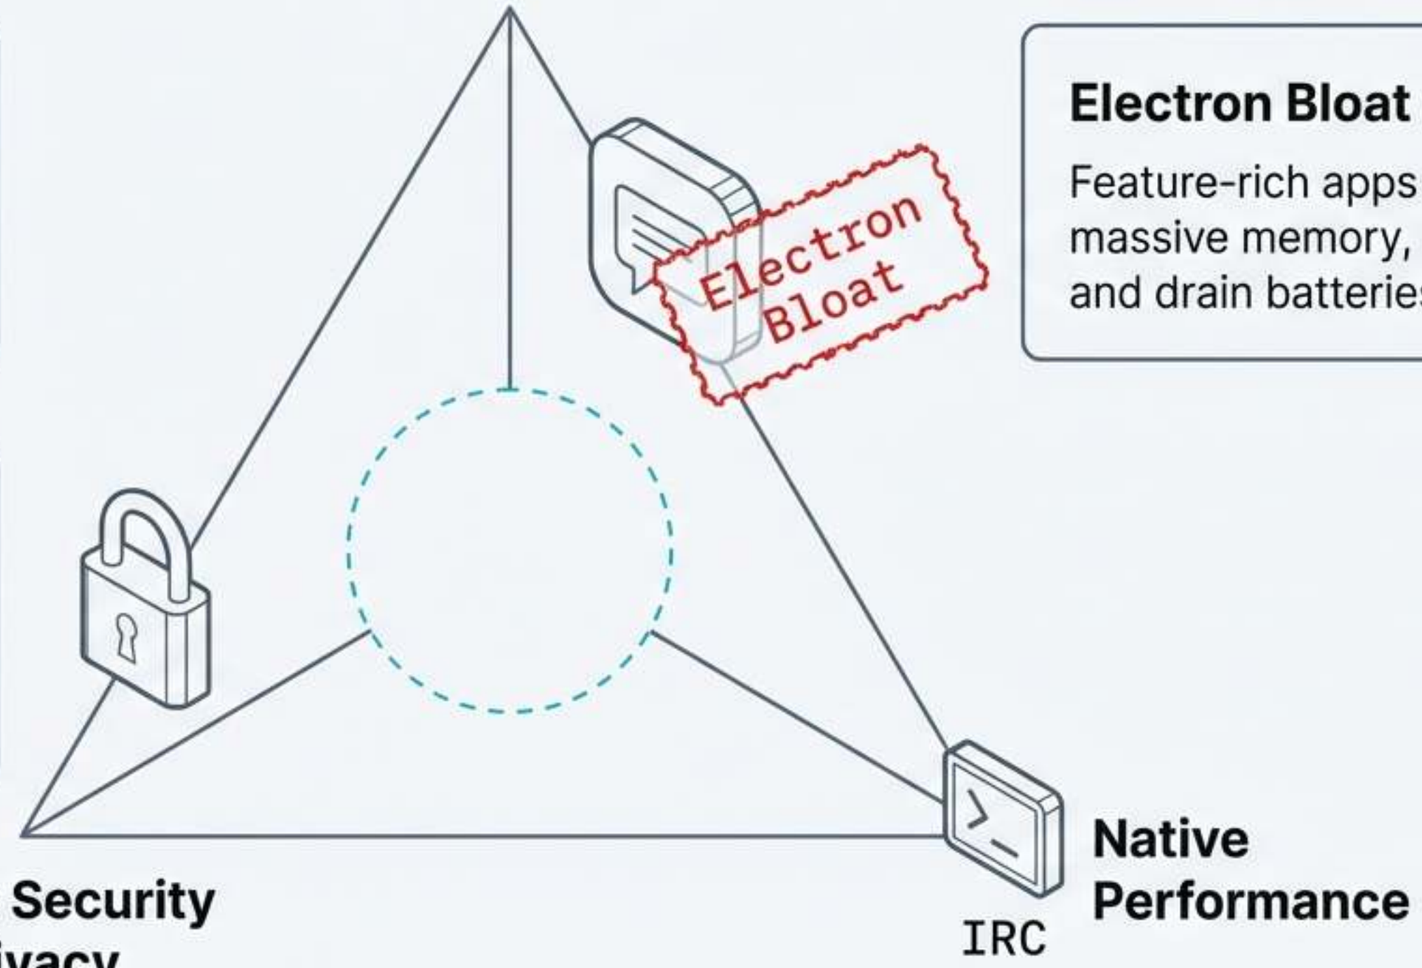

The False Choice of Modern Communication

Feature Poverty

Truly secure applications strip away essential enterprise collaboration tools.

Privacy Theater

Standard E2EE applications still expose critical metadata to central servers.

Electron Bloat

Feature-rich apps consume massive memory, stall UIs, and drain batteries.

NotebookLM

Introducing Chatter Linux

100+ premium features engineered into a production-grade native client.

Pure Native Execution

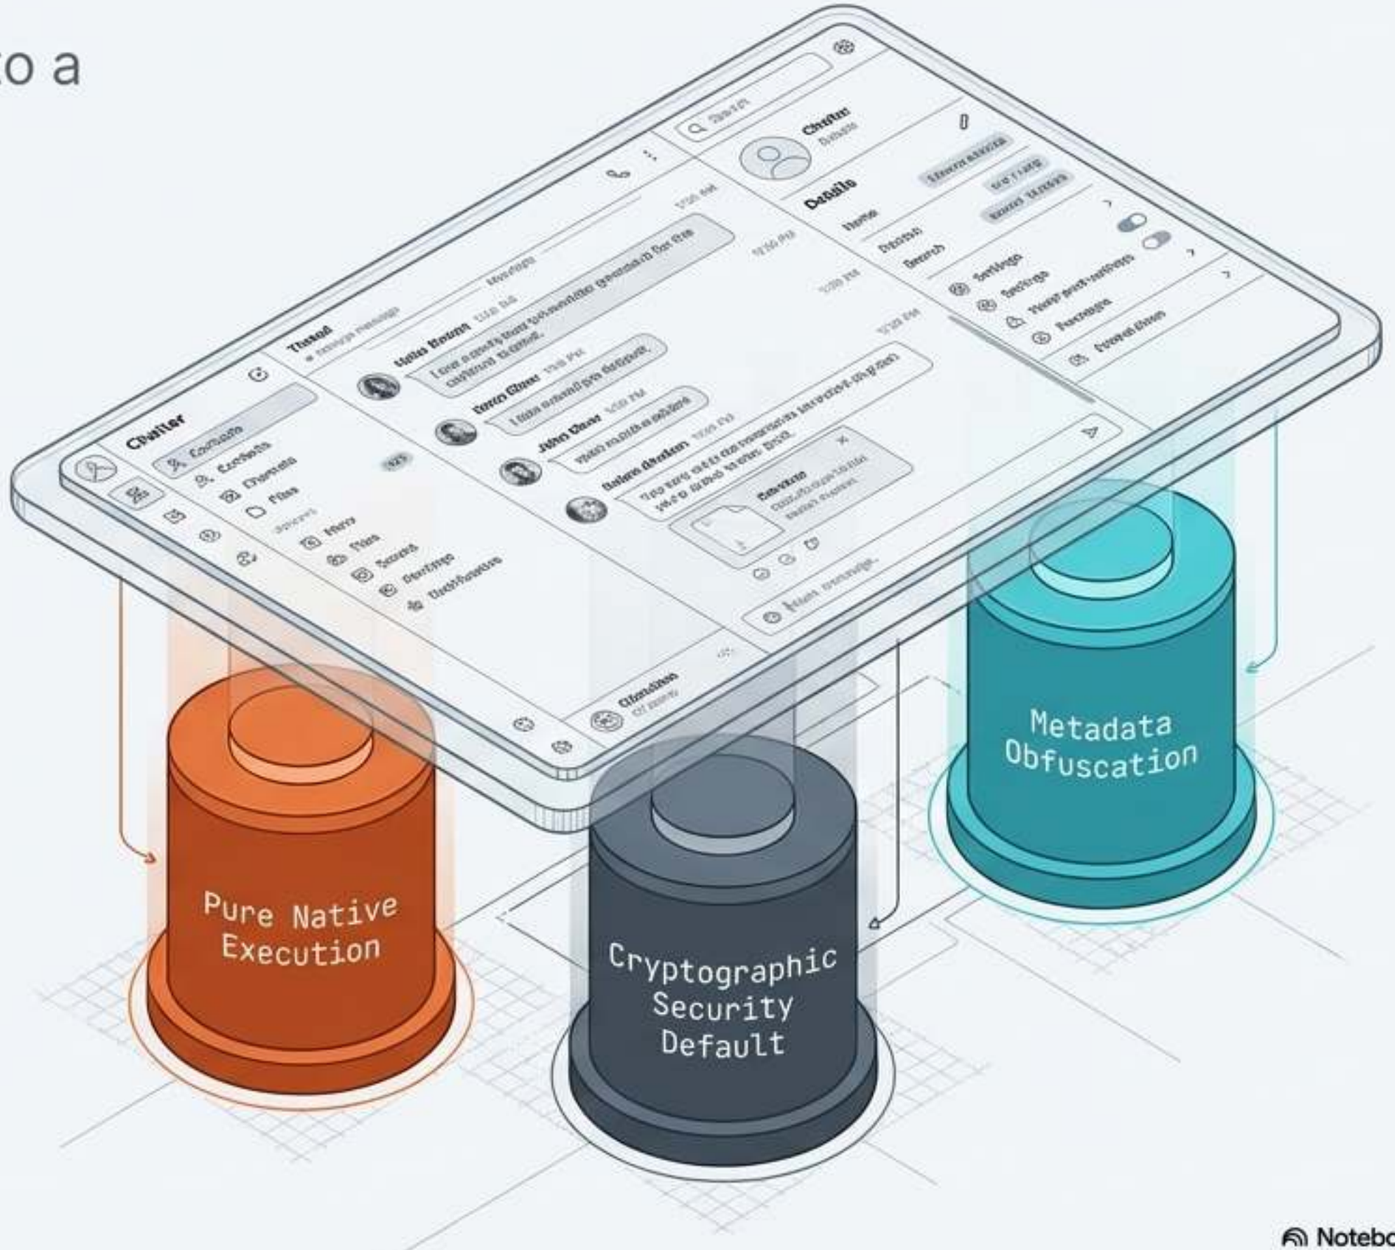

Rust & Slint architecture for microsecond UI rendering.

Cryptographic Security Default

Signal-protocol E2EE for all data in transit and at rest.

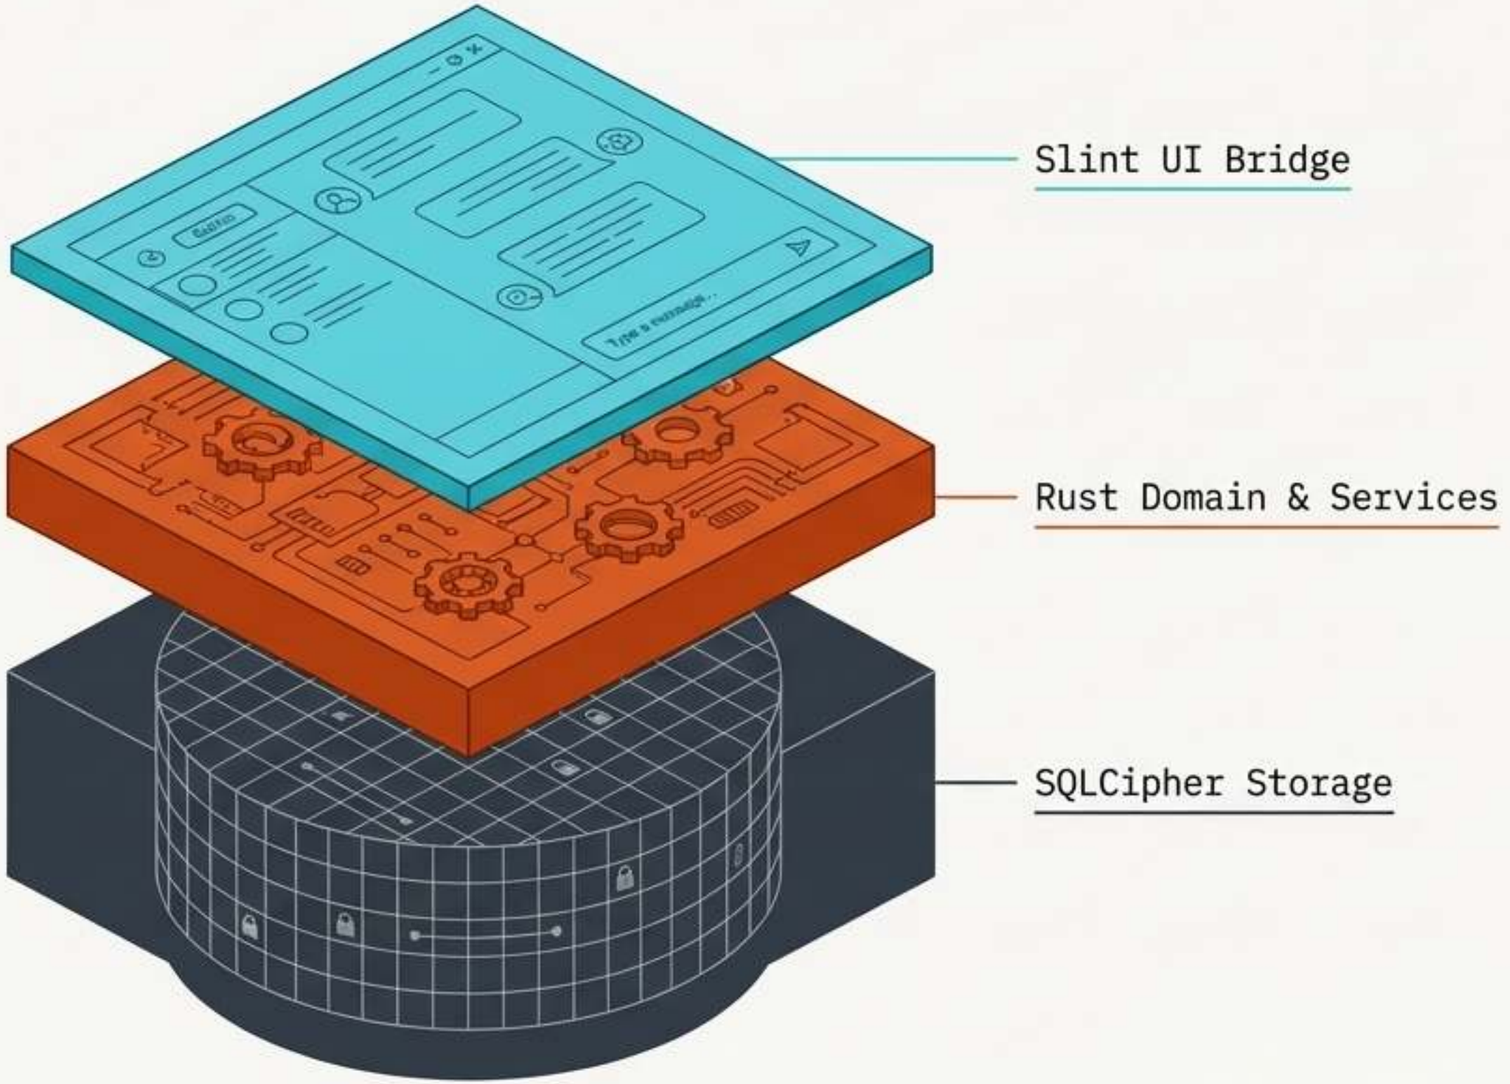

Metadata Obfuscation

Next-generation anonymous routing that hides who you talk to.

NotebookLM

Blistering Speed. Zero Electron.

Rust Core

Memory-safe, async-first execution enforcing strict separation of concerns.

Slint UI Bridge

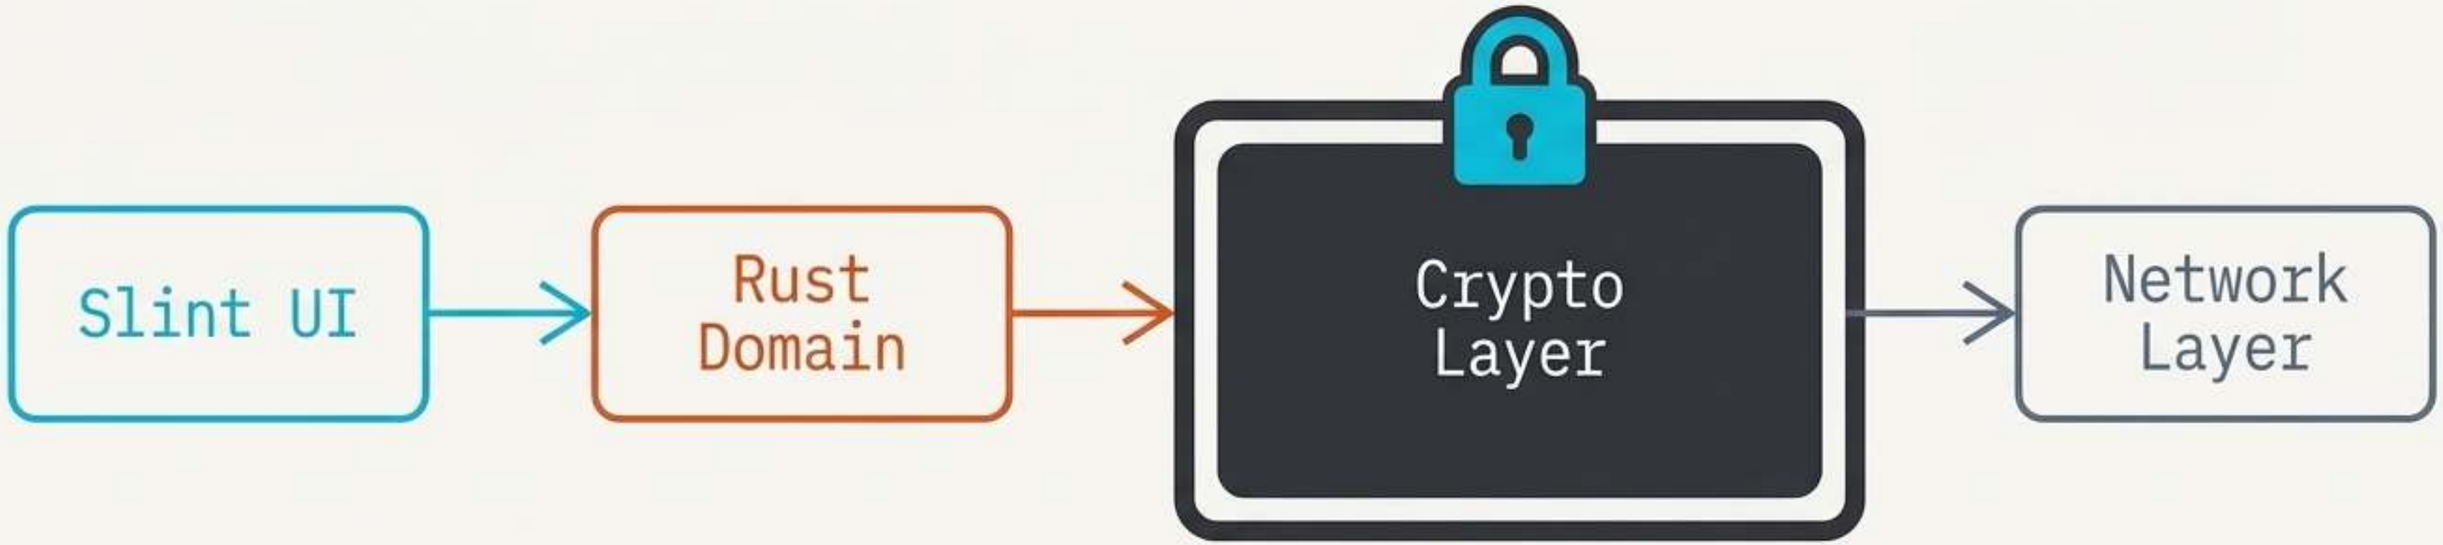

Direct UI binding to Rust state for microsecond render times.

Resource Efficiency

Implementation of Message Virtualization, bounded LRU caches, and lazy message decryption to keep memory footprint minimal.

NotebookLM

Security is the Default, Not an Option

Signal Protocol

Industry-standard End-to-End Encryption utilized for Direct Messages, Groups, and Calls.

Encrypted Persistence

All local application data secured via SQLCipher and the OS-level system keyring.

Zero-Copy Decryption

Plaintext exists exclusively in secure, volatile memory. It is never written to disk, never logged, and relies on constant-time cryptographic comparisons.

NotebookLM

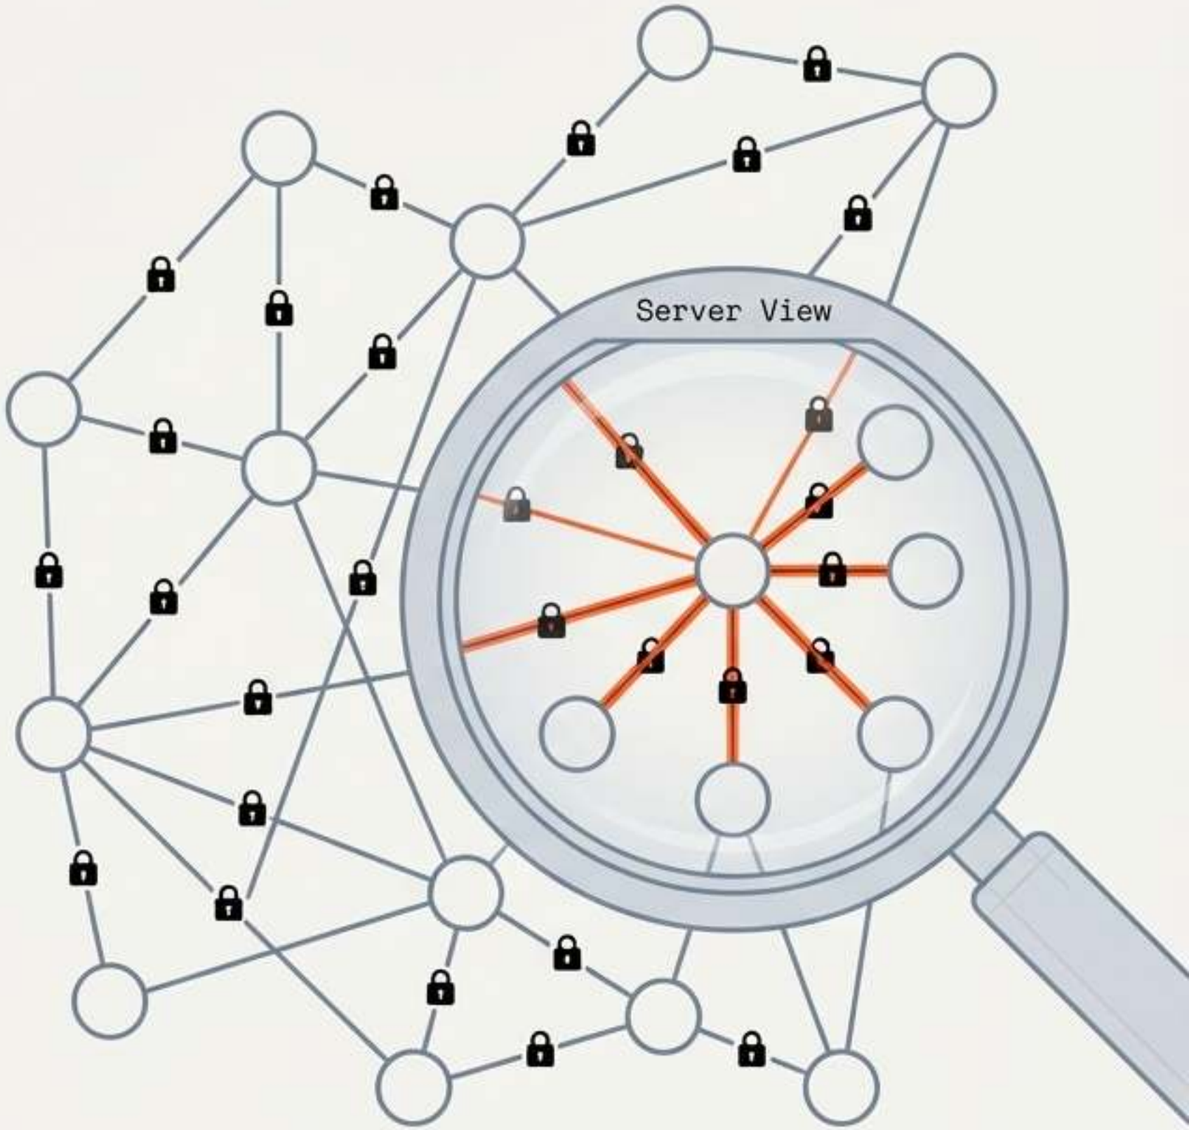

E2E Encryption Hides Your Words, Not Your Network

The Metadata Vulnerability

Standard E2EE prevents the server from reading your messages, but leaves who you talk to, when, and how often entirely visible.

The Threat Vector

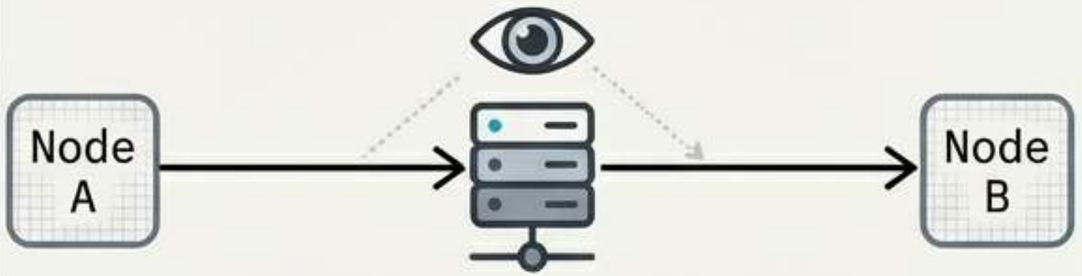

Statistical Disclosure Attacks (SDAs) allow compromised servers or hostile actors to map organizational structures and relationship dynamics purely through traffic patterns.

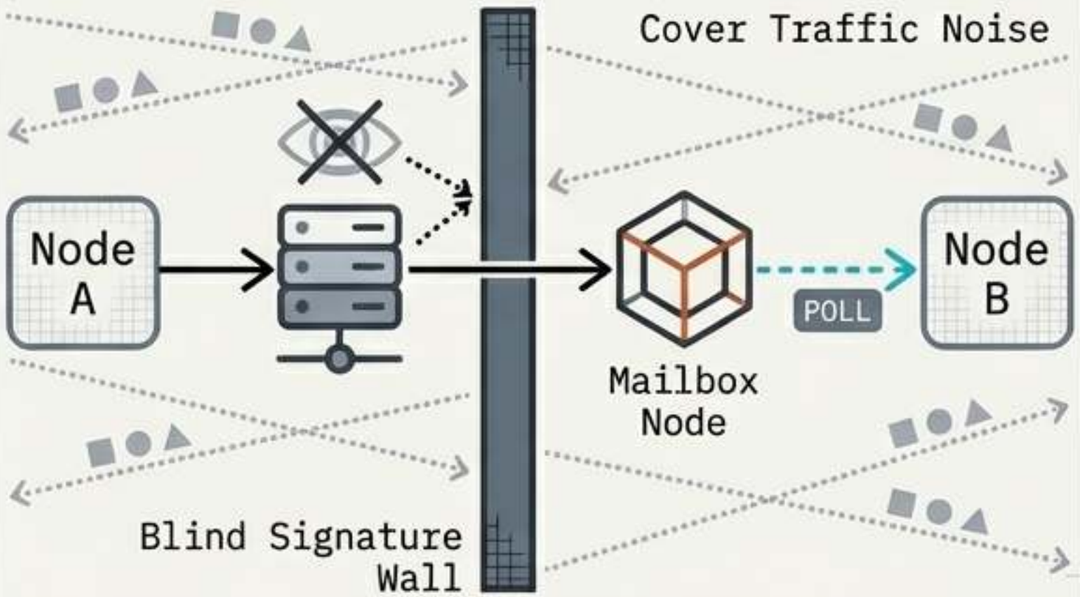

NotebookLM

Total Anonymity via Ephemeral Mailboxes

Standard E2EE (Flawed)

NDSS '21 Ephemeral Routing

No Long-Term IDs

Messages route through privacy-pre- ar ephemeral anonymous mailboxes, severing sender-receiver correlation.

Blind Tokens

Daily cryptographic blind signatures ensure the server cannot link a user to their active mailbox.

Cover Traffic

Optional, system-generated noise traffic intentionally destroys any remaining traffic analysis attempts.

NotebookLM

Seamless Multi-Device Coordination

Offline-First Architecture

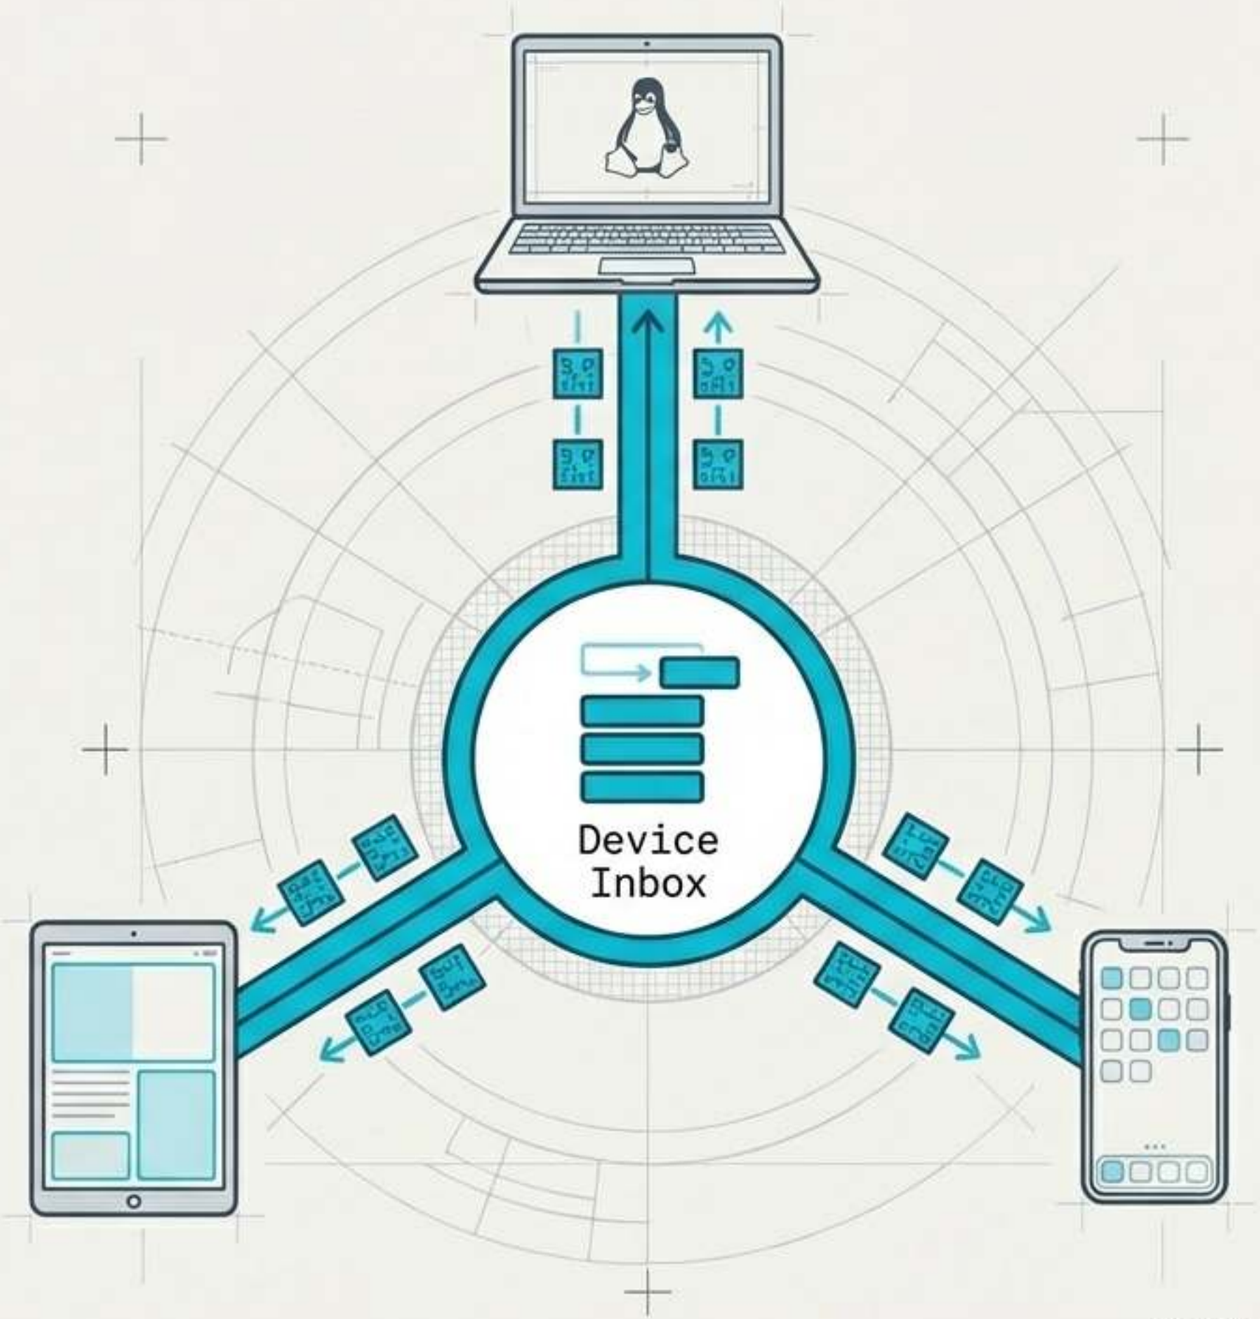

Full read/write functionality remains intact without a network connection, executing background gRPC syncs when connectivity is restored.

The Device Inbox

All incoming encrypted payloads, key exchanges, and real-time events route through a decentralized, **multi-device queue** for perfect synchronization.

Automatic Recovery

Robust **connection pooling** and exponential backoff mechanisms ensure network resilience under any condition.

NotebookLM

An Enterprise-Grade Feature Ecosystem

(-0, 0.0)

(-0, 0.0)

Core Messaging

- Threaded conversations
- Auto-saving Drafts
- Telegram-style Pinned Bars
- `Personal Message Vaults`

Rich Media

- `Virtualized code previews` with syntax highlighting
- Native PDF navigation
- Resumable file uploads

Voice & Video

- LiveKit-integrated encrypted calls
- High-fidelity voice memos
- Screen sharing
- Connection recovery

Moderation

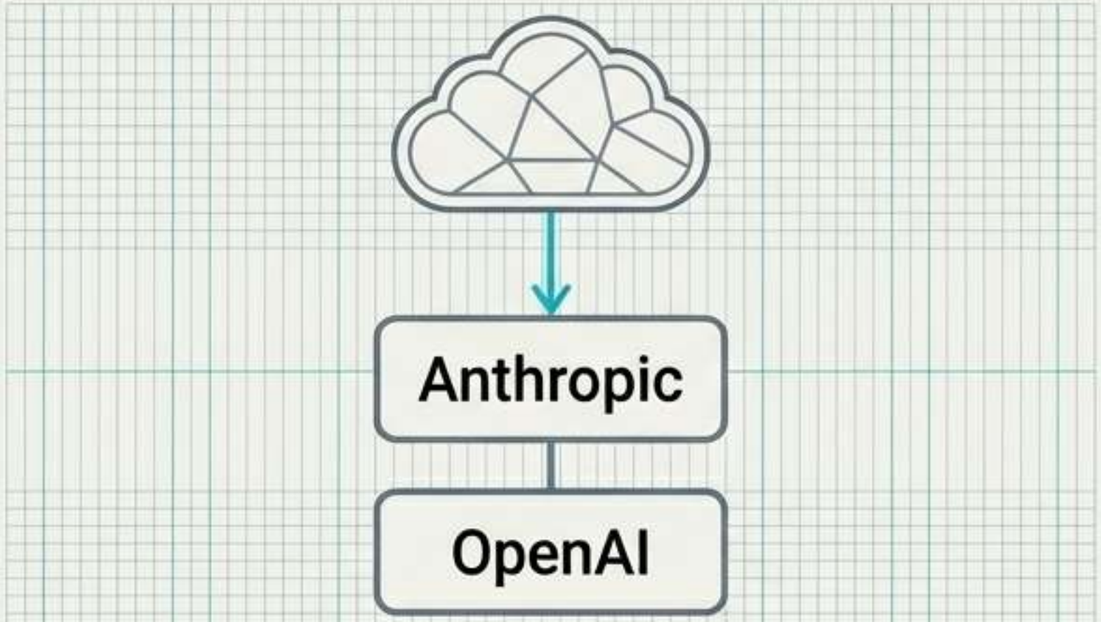

- Granular channel roles
- Hierarchical permissions
- Complete moderation toolsets
- Banning and muting capabilities

NotebookLM

First-Class AI, On Your Terms

Cloud Models

Native integrations with top providers (GPT, Claude) for standard team assistance in dedicated AI channels.

Privacy Boundary

Ollama

vLLM

Local AI Inference

Full, privacy-preserving support for Ollama, vLLM, and MLC-LLM backends running directly on the client.

Semantic Search

Generate local vector embeddings to run similarity searches across your chat history without ever exposing data to a server.

NotebookLM

The Chat Client Landscape

	Legacy Enterprise	Consumer E2EE	Chatter Linux
Architecture	Web/Electron	Web/Electron	**Native Rust/Slint**
Memory Footprint	Heavy	Heavy	**Ultra-Light**
Message Encryption	In-Transit Only	Signal Protocol	Signal Protocol
Metadata Privacy	None	Sealed Sender	**NDSS Ephemeral Mailboxes**
AI Integration	Cloud Only	None	**Cloud + Local Private AI**

NotebookLM

The Future of Collaboration is Native.
1. Built in Rust & Slint for unmatched performance efficiency.
2. Secured by the Signal Protocol & Ephemeral Mailboxes.
3. Packed with 100+ premium features and Private Local AI.
Deploy Chatter Linux Today.
